

LTW REFRIGERATED

HIGH SATISFACTION AT LOW TEMPERATURES

Our job is to find a simple solution to complex processes. As an expert in developing and implementing turnkey intralogistics systems, LTW Intralogistics is your full-service provider

for all requirements relating to the organization, control, implementation and optimization of the internal flows of goods and materials.

Tailored to your needs

The requirements of our customers are as diverse as the intralogistics systems themselves. We first entered the frozen food industry as far back as in 1991 – at the request of a customer. For one long-standing customer, their range of business fields had expanded and the need for a cold storage facility became acute.

Even back then, we accepted the challenge and were able to impress with competent advice and high-quality execution.

Global success in the frozen food sector

Since 1991, we have successfully implemented over 100 frozen food projects around the world with 267 stacker cranes. We have then been able to accumulate considerable know-how in the frozen food sector over the years that have followed. Fully automated operation of an intralogistics system at -28°C demands a high standard of planning and equipment design.

Experience is essential for correctly estimating material shrinkage, and for paying attention to important details – from choosing a suitable gear oil for cold temperatures, to deciding which heatable electrical components to use. In addition, fine motor work at these temperatures places high demands on our team and tools.

Working at -28°C

Our intralogistics systems are cleverly designed down to the smallest detail. After all, they not only have to run smoothly, but also be easy to service: a major challenge in the frozen food sector in particular.

Our equipment is easy to maintain, ensuring that work is easily completed, even when wearing gloves to keep out the cold.
